

# LINEAR ALGEBRA

## LECTURE 1: ELEMENTS IN LINEAR ALGEBRA

goorm

**KAIST AI**  
Graduate School of AI

# Lecture Overview

- Elements in linear algebra
- Linear system
- Linear combination, vector equation,  
Four views of matrix multiplication
- Linear independence, span, and subspace
- Linear transformation
- Least squares
- Eigendecomposition
- Advanced eigendecomposition
- Singular value decomposition

# Scalar, Vector, and Matrix

- Scalar: a single number  $s \in \mathbb{R}$  (lower case), e.g., 3.8
- Vector: an ordered list of numbers, e.g.  $\mathbf{x} = \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix} \in \mathbb{R}^n$  (boldface, lower-case), e.g.,  $\mathbf{x} = \begin{bmatrix} 1 \\ 0 \\ 2 \end{bmatrix} \in \mathbb{R}^3$
- Matrix: a two-dimensional array of numbers, e.g.  $A = \begin{bmatrix} 1 & 6 \\ 3 & 4 \\ 5 & 2 \end{bmatrix} \in \mathbb{R}^{3 \times 2}$  (capital letter)
  - Matrix size:  $3 \times 2$  means 3 rows and 2 columns
  - Row vector: a horizontal vector
  - Column vector: a vertical vector

# Column is Vertical Vector (Don't be Confused!)

# Column Vector and Row Vector

- A vector of  $n$ -dimension is usually a column vector, i.e., a matrix of the size  $n \times 1$

- $\mathbf{x} = \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix} \in \mathbb{R}^n = \mathbb{R}^{n \times 1}$

- Thus, a row vector is usually written as its transpose, i.e.,

- $\mathbf{x}^T = \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix}^T = [x_1 \quad x_2 \quad \cdots \quad x_n] \in \mathbb{R}^{1 \times n}$

# Matrix Notations

- $A \in \mathbb{R}^{n \times n}$  : **Square** matrix (#rows = #columns)
  - e.g.,  $B = \begin{bmatrix} 1 & 6 \\ 3 & 4 \end{bmatrix}$
- $A \in \mathbb{R}^{m \times n}$  : **Rectangular** matrix (possible: #rows  $\neq$  #columns)
  - e.g.,  $A = \begin{bmatrix} 1 & 6 \\ 3 & 4 \\ 5 & 2 \end{bmatrix}$
- $A^T$  : **Transpose** of matrix (mirroring across the main diagonal)
  - e.g.,  $A^T = \begin{bmatrix} 1 & 3 & 5 \\ 6 & 4 & 2 \end{bmatrix}$
- $A_{ij}$  :  $(i, j)$ -th component of  $A$ , e.g.,  $A_{2,1} = 3$
- $A_{i,:}$  :  $i$ -th row vector of  $A$ , e.g.,  $A_{2,:} = \begin{bmatrix} 3 & 4 \end{bmatrix}$
- $A_{:,j}$  :  $j$ -th column vector of  $A$ , e.g.,  $A_{:,2} = \begin{bmatrix} 6 \\ 4 \\ 2 \end{bmatrix}$

# Vector/Matrix Additions and Multiplications

- $C = A + B$  : Element-wise **addition**, i.e.,  $C_{ij} = A_{ij} + B_{ij}$

- $A, B, C$  should have the same size, i.e.,  $A, B, C \in \mathbb{R}^{m \times n}$

- $ca, cA$  : **Scalar multiple** of vector/matrix

- e.g.,  $2 \begin{bmatrix} 3 \\ 2 \\ 1 \end{bmatrix} = \begin{bmatrix} 6 \\ 4 \\ 2 \end{bmatrix}, 2 \begin{bmatrix} 1 & 6 \\ 3 & 4 \\ 5 & 2 \end{bmatrix} = \begin{bmatrix} 2 & 12 \\ 6 & 8 \\ 10 & 4 \end{bmatrix}$

- $C = AB$  : Matrix-matrix multiplication, i.e.,  $C_{ij} = \sum_k A_{i,k} B_{k,j}$

- e.g.,  $\begin{bmatrix} 1 & 6 \\ 3 & 4 \\ 5 & 2 \end{bmatrix} \begin{bmatrix} 1 & -1 \\ 2 & 1 \end{bmatrix} = \begin{bmatrix} 13 & 5 \\ 11 & 1 \\ 9 & -3 \end{bmatrix}, [3 \ 2 \ 1] \begin{bmatrix} 1 \\ 3 \\ 5 \end{bmatrix} = [14], \begin{bmatrix} 1 \\ 3 \\ 5 \end{bmatrix} [1 \ 2] = \begin{bmatrix} 1 & 2 \\ 3 & 6 \\ 5 & 10 \end{bmatrix}$

Size:  $(3 \times 2)(2 \times 2) = 3 \times 2, \quad (1 \times 3)(3 \times 1) = 1 \times 1, \quad (3 \times 1)(1 \times 2) = 3 \times 2$

# Matrix multiplication is **NOT** commutative

- $AB \neq BA$  : Matrix multiplication is **NOT** commutative.
- e.g., Given  $A \in \mathbb{R}^{2 \times 3}$  and  $B \in \mathbb{R}^{3 \times 5}$ ,  $AB$  is defined, but  $BA$  is not even defined.
- What if  $BA$  is defined, e.g.,  $A \in \mathbb{R}^{2 \times 3}$  and  $B \in \mathbb{R}^{3 \times 2}$ ? Still, the sizes of  $AB \in \mathbb{R}^{2 \times 2}$  and  $BA \in \mathbb{R}^{3 \times 3}$  does not match, so  $AB \neq BA$ .
- What if the sizes of  $AB$  and  $BA$  match, e.g.,  $A \in \mathbb{R}^{2 \times 2}$  and  $B \in \mathbb{R}^{2 \times 2}$ ? Still in this case, generally,  $AB \neq BA$ .
- E.g.,  $\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \begin{bmatrix} 5 & 6 \\ 7 & 8 \end{bmatrix} = \begin{bmatrix} 19 & 22 \\ 43 & 50 \end{bmatrix}, \quad \begin{bmatrix} 5 & 6 \\ 7 & 8 \end{bmatrix} \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} = \begin{bmatrix} 23 & 34 \\ 31 & 46 \end{bmatrix}$

# Other Properties

- $A(B + C) = AB + AC$  : Distributive
- $A(BC) = (AB)C$  : Associative
- $(AB)^T = B^T A^T$  : Property of transpose
